33. CreateExcel

Process all data that will be written to the Excel file.

The process starts from reading the template Excel files.

This will process the replacement of placeholders from the template file.

After the process from template, the Excel file will be written to the specified save path.

<i>

Version history:

 Version 1.0 - This has to be the simplest solution, but cell style was the problem.

 Version 1.5 - No methods added, just some logic. Cell style problem was fixed, but doesn't support the multiple detail placeholder.

Version 2.0 - This version supports the detail placeholder, which works almost the same as the JasperReports.

But the current version only supports fixed column size, which means you can't exceed to your

template's number of columns, but row is capable of dynamic count. Methods were added to support

the new placeholder. Moved the old logic to the bottom most this class.

See Detail Placeholder sample @ <http://pastebin.com/ZMLLGAMp>,

and <https://www.dropbox.com/s/kiluqafq8ofmxo8/template.xlsx> for sample template file.

</i>

Note: <i> Please see the JXLSUtil.java @ <http://pastebin.com/Rf4FW9ir>, this was for the mergeExcelFiles() method.</i>

If you have questions or feedback, please don't hesitate to contact me. This will help us and others a lot!

33.2. Attributes Summary

Name	Description
 file_path	Path of the template Excel file.
 placeholders	Contains the placeholders together with their value. <i> Note that the placeholder from the template should starts with dollar sign (\$). But dollar sign when putting placeholder in HashMap is not necessary.
 save_path	Path for the resulting Excel file.
 sheet_index	Sheet index of your template.
 sheet_name	Sheet name for the resulting Excel workbook.

33.3. Operations Summary

Name	Description
 checkSavePath	Check the nullity or emptiness value of save path.

Name	Description
	<i><i></i> Note: File name will be out.xlsx by default. <i></i></i> @since 1.0
 CreateExcel	Create an Excel file that will contains the process data. You must have the template Excel file before invoking this method, because this is an dependent processing of Excel file. This needs a template file to create a resulting Excel file. <i><i></i> Note: If save path is null or empty, it will be moved to your Desktop directory. And for file path, null or empty value will be handled by the IOException. Also the placeholder from the template should starts with dollar sign (\$), but not necessary when putting in the Hashmap. Ex. map.put("replaceMe", "Hello"); <i></i></i>
 doSaveExcelFile	Save/Write the resulting excel file to the specified file path. Any caught exception such as IOException will interrupt the saving of file. <i><i></i> Warning: This will replace the old file if there's already exists! If you want to avoid overwritten of file, please do a simple evaluation first before calling this method. <i></i></i> @since 1.0
 execute	Process the creation of the Excel report. @since 1.0
 getValue	Get the value from the Hashmap by key. The key is the placeholder from your template Excel file. @since 1.0
 getValueArr	Get the value in ArrayList from the Hashmap by key. The key is the placeholder from your template Excel file. @since 2.0
 isDetailPlaceholder	Check if the cell is a detail placeholder. A detail placeholder always starts with <i>percent sign (%)</i>. @since 2.0
 isEndingCell	Check if the cell is the ending cell (#end). @since 2.0
 isPlaceholder	Checks if the cell is a placeholder. A placeholder always starts with a <i>dollar sign (\$)</i>. @since 1.0

33.4. Attributes

33.4.1. file_path

Path of the template Excel file.

Visibility	private
Type	String

33.4.2. placeholders

Contains the placeholders together with their value.
Note that the placeholder from the template should starts with dollar sign (\$). But dollar sign when putting placeholder in HashMap is not necessary.

Visibility	private
Type	Map<String, Object>

33.4.3. save_path

Path for the resulting Excel file.

Visibility	private
Type	String

33.4.4. sheet_index

Sheet index of your template.

Visibility	private
Type	int

33.4.5. sheet_name

Sheet name for the resulting Excel workbook.

Visibility	private
Type	String

33.5. Operations

33.5.1. checkSavePath

Check the nullity or emptiness value of save path.
Note: File name will be out.xlsx by default.

<i>

</i>

@since 1.0

Visibility	private
Return Type	String

33.5.2. CreateExcel

Create an Excel file that will contains the process data.

You must have the template Excel file before invoking this method, because this is an dependent processing of Excel file. This needs a template file to create a resulting Excel file.

<i>

Note: If save path is null or empty, it will be moved to your Desktop directory.

And for file path, null or empty value will be handled by the IOException.
 Also the placeholder from the template should starts with dollar sign (\$),

but not necessary when putting in the Hashmap.
 Ex. map.put("replaceMe", "Hello");

</i>

Visibility	public
------------	--------

33.5.3. doSaveExcelFile

Save/Write the resulting excel file to the specified file path.

Any caught exception such as IOException will interrupt the saving of file.

<i>

Warning: This will replace the old file if there's already exists!

If you want to avoid overwritten of file, please do a simple evaluation first before calling this method.

</i>

@since 1.0

Visibility	private
------------	---------

Return Type	boolean
-------------	---------

33.5.4. execute

Process the creation of the Excel report.

@since 1.0

Visibility	public

Return Type	boolean
-------------	---------

33.5.5. getValue

Get the value from the Hashmap by key.

The key is the placeholder from your template Excel file.

@since 1.0

Visibility	private
------------	---------

Return Type	String
-------------	--------

33.5.6. getValueArr

Get the value in ArrayList from the Hashmap by key.

The key is the placeholder from your template Excel file.

@since 2.0

Visibility	private
------------	---------

Return Type	ArrayList<ArrayList>
-------------	----------------------

33.5.7. isDetailPlaceholder

Check if the cell is a detail placeholder.

A detail placeholder always starts with <i>percent sign (%)</i>.

@since 2.0

Visibility	private
------------	---------

Return Type	boolean
-------------	---------

33.5.8. isEndingCell

Check if the cell is the ending cell (#end).

@since 2.0

Visibility	private
------------	---------

Return Type	boolean
-------------	---------

33.5.9. isPlaceholder

Checks if the cell is a placeholder.
 A placeholder always starts with a `$</i>`.
 @since 1.0

Visibility	private
Return Type	boolean
